

MOSE

The daily-ritual supplement in a drinkable vial — an evidence-led "dose you never miss," built as a morning-to-night system. This dossier puts the product, science, market, pricing, unit economics, manufacturing, regulatory and go-to-market in one place.

Prepared July 2026 · Figures cited inline; all pricing & financials are illustrative planning assumptions, not sourced facts. · Companion to the live concept site →

~A\$2-6M

Illustrative 3-yr obtainable revenue (SOM), AU-first

01 · EXECUTIVE SUMMARY

A daypart supplement system, riding the creatine wave.

MOSE is a single-serve drinkable vial with a dual-chamber cap that keeps dry actives sealed away from the liquid until use — "Pop, Shake, Pull." It ships as three colour-coded daypart formulas (PRIME AM, DRIVE midday, SETTLE PM), all anchored on creatine, the breakout supplement of 2024-25.

The tailwind is real and sourced: global creatine is ~US\$1.2-1.4B (2025) growing 20-26%/yr, sitting inside a ~US\$51-72B sports-nutrition category and a ~US\$150-170B functional-beverage category. Demand for *convenient* creatine is exploding (creatine gummies +360% dollar YoY; "creatine gummies" search +1,300% YoY), and the buyer base is broadening beyond male gym-goers — women rose from ~18% to ~30% of creatine purchases.

The white space is twofold. No named competitor owns a morning-to-night daypart *system* in one product line — and the dry-in-cap chamber is a demonstrable dose-integrity answer to a format war where independent testing found ~46% of creatine gummies failed their label claims (and pre-mixed creatine in liquid loses ~90% of its potency in 45 days). MOSE sells sequencing + freshness + ritual, not another ingredient list.

The plan: launch DTC in Australia — an under-served premium single-serve market where LMNT is barely present — with one hero SKU, price as a premium daily ritual (~A\$149/month subscription; ~US\$99 in the US), then open the US, which holds 40.8% of creatine spend, for scale. Illustrative unit economics support ~50% gross margin at RRP and a ~3:1 contribution LTV:CAC with sub-two-month payback — *provided the model runs on bundles and subscriptions, never single tubes*. A defensible 3-year obtainable revenue is ~A\$/US\$2-6M ARR.

02 · THE PRODUCT

One vial. Three moments. Pop · Shake · Pull.

Dry actives sit sealed in the cap, away from the water, until you need them. Press the cap to pop them into the mix, shake to blend, then pull the lid off and drink. The tactile ritual solves a real potency problem — creatine and hygroscopic actives stay dry (stable 3+ years) until the second they're consumed.

PRIME · AM

Wake the system up.

Creatine + electrolytes + a caffeine / L-theanine focus pairing. Start the day hydrated, alert and topped up.

DRIVE · MIDDAY

Hold the line.

Creatine + essential amino acids + a lower-caffeine L-theanine pairing. Protect focus and recovery through the afternoon.

SETTLE · PM

Land the day.

Magnesium glycinate + glycine + lavender (low-dose melatonin only where legal). Down-shift and cue sleep.

Why the cap matters. Dry creatine monohydrate is stable 3+ years even above 40°C; dissolved in water it degrades to inactive creatinine fast (~90% loss in 45 days at room temperature). Keeping actives dry until the moment of use is the product's reason to exist — a freshness claim no gummy, powder tub or pre-mixed RTD can credibly make.

03 · THE SCIENCE

Doses you can point to a study for.

Every active is here because human trials back it, and doses sit deliberately at the well-tolerated lower end — enough to do the job, gentle enough for daily use

across a wide audience. Evidence strength is graded honestly; several are moderate or preliminary, not overstated.

FORMULA	ACTIVE	CONSERVATIVE DOSE	PRIMARY BENEFIT	EVIDENCE	KEY CITATION
PRIME	Creatine monohydrate	3 g	Performance, lean mass, recovery; emerging cognition	STRONG PRELIM (COGNITION)	Kreider 2017, Int Soc Sports Nutr PMID 28615996

	Lavender (Silexan-grade)	80 mg / aroma	Calm / wind-down cue	MODERATE	Kasper 2014, PMID

FORMULA	ACTIVE	CONSERVATIVE DOSE	PRIMARY BENEFIT	EVIDENCE	KEY CITATION
					24456909

Regulatory reality on melatonin. The low-dose sleep evidence is strong, but melatonin is a **prescription medicine in Australia, the UK and Canada**, and dose-capped as a supplement in the EU (**≤1 mg**; **≤0.44 mg in Slovenia**, JAZMP — above that it is a medicine). There is no supplement route for a 3–5 mg daily vial anywhere in these markets — so SETTLE ships melatonin in the **US only** (or ≤0.44 mg for a Slovenia launch), and the AU/UK/EU version leans on magnesium glycinate + glycine + lavender. This shapes the whole launch sequence (see Regulatory).

Evidence downgrades vs. a naïve read: creatine-for-cognition is preliminary at 3 g (the headline cognition trial used ~25 g); magnesium's sleep meta pooled mostly magnesium *oxide*; L-theanine alone is weak (the effect is largely caffeine-driven); EAA's 6 g is validated mainly in younger adults (older adults may need ~10–15 g).

A booming core active inside two huge categories.

Creatine is the breakout supplement of 2024–25. Estimates vary 2–3× across research firms, so every figure below is a range with its source — but every source shows double-digit growth well above the broader supplement market.

US\$1.2–1.4B

Global creatine market, 2025
Grand View 1.37B · R&M 1.2B · FMI 0.64B

US\$51–72B

Global sports-nutrition market, 2025
Polaris–Grand View, 7.4–8.7% CAGR

US\$150–170B

Global functional-beverage market
Mordor–Precedence, 2025

~US\$4.0B

Australia & NZ dietary supplements
Grand View 2025 (~US\$3.98B)

Creatine market — where the growth points

Global creatine supplements, USD. Grand View's high-end trajectory shown; firms diverge sharply (see note).

2025		\$1.37B
2033 (proj.)		\$8.68B · 26.2% CAGR

Range across firms: 2025 base ~US\$0.64–1.66B; CAGR ~13% (FMI) to 26.2% (Grand View). Powder still holds 80.4% of creatine revenue — drinkable single-serve is the small but fastest-growing niche.

Convenient-format demand is the real signal

Year-on-year growth, creatine convenience formats

Creatine sales (MULO)		+71.9%
Gummy dollar growth		+360%
"Creatine gummies" search		+1,300%

SPINS (52 wks) & Vitamin Shoppe 2025. Growth off a small base — but the direction is unambiguous.

The buyer base is broadening

Creatine is escaping the "male gym-goer" box — the core of MOSE's broad-audience thesis.

Women 2020 | ~18%

Women 2025 | ~30%

Circana via Bloomberg. Women projected to contribute >US\$9B in sports-nutrition revenue. Adults 50+ (cognition/longevity) are a second fast-growing cohort — a 2025 review found 5 of 6 studies positive (n=1,542, 56% female).

TAM → SAM → SOM

TAM

~US\$1.2-1.4B core

Global creatine spend today (the anchored active), inside a ~US\$55B sports-nutrition / ~US\$160B functional-beverage halo.

SAM

~US\$0.5-1.0B

AU + US + UK creatine-anchored convenient formats. NA 40.8% + UK ~7% + AU ~3% ≈ 51% of creatine spend, plus a convenient-format premium. *Derived.*

SOM

~A\$/US\$2-6M ARR

3-year, AU-first: ~0.3-0.8% of SAM = 3,000-12,000 subscribers × ~A\$700-950/yr. Scales meaningfully on US entry. *Illustrative.*

A crowded field of single-category players.

MOSE touches cheap creatine powders, convenience gummies, electrolyte sticks, greens scoops and wind-down drinks — but no named competitor owns the single-serve, daypart-sequenced AM/midday/PM ritual. The hard fights are price-per-serve justification and distribution-rich incumbents.

Price per serve — MOSE prices as a premium ritual

Approx. USD per serve (AU items converted). MOSE shown at subscription price. MOSE highlighted.

Optimum (powder)	\$0.50
Thorne (powder)	\$0.48
Hydralyte (AU)	\$0.54
Moon Juice PM	\$1.44
LMNT stick	\$1.50
Liquid I.V.	\$1.50
Create gummy	\$2.04
AG1 (sub)	\$2.63
Recess Mood	\$2.99
MOSE (sub)	\$3.30

MOSE sits in the AG1 / RTD-shot premium tier, not the electrolyte-stick tier — the ritual + daypart system + freshness must carry that premium. The "one vial replaces three purchases" frame is the answer to a DIY stack under ~US\$2.

BRAND	FORMAT	~PRICE/SERVE	POSITIONING
Optimum / Thorne / Momentous	Micronized creatine powder	\$0.36-0.66	Value → athlete-grade; the DIY benchmark
Create · Bear Balanced	Creatine gummies	\$1.67-2.41	Convenience creatine — but ~46% label-fail problem
SUP (AU)	Creatine gummy	~A\$1.60	Budget, supermarket shelf (Woolworths/Coles)
Applied Nutrition · Bio-Synergy	Effervescent creatine tablet	n/a	Portable fizzy creatine / creatine-hydration
LMNT · Liquid I.V. · Waterdrop	Single-serve hydration	\$1.22-1.75	Premium/mass hydration (LMNT barely in AU)
AG1 (Athletic Greens)	All-in-one greens scoop	\$2.63-3.30	Premium "one daily scoop" ritual — the ritual benchmark
Moon Juice Magnesi-Om	PM powder drink mix	\$1.40-1.47	Premium wind-down — direct SETTLE analog
Recess Mood	RTD sparkling (calm)	~\$2.99	Funded (\$68M), 30k+ doors — the RTD threat
MOSE	Daypart drinkable vial (dual-chamber cap)	\$3.30-4.25	AM→PM system + dry-in-cap freshness — unoccupied

Premium ritual pricing — that only works on subscription.

Price in the greens-travel-pack / RTD-shot tier (US\$3-4/serve), not against electrolyte sticks. Single tubes are structurally unprofitable once fulfilment and payment fees hit; the model lives on the 30-tube box. All numbers below are illustrative and must be confirmed with real co-manufacturer quotes before RRP is locked.

MARKET	SINGLE TUBE	SUBSCRIPTION (30/MO)	ONE-TIME BUNDLE
United States	US\$4.25	US\$3.30 (\$99/box)	US\$119
Australia	A\$6.50	A\$4.97 (A\$149/mo)	A\$179

Subscription per-tube sits ~22% below single RRP to reward commitment, while the single-tube trial stays psychologically under US\$5 / A\$7.

Illustrative landed COGS per tube ≈ US\$2.02

The dual-chamber cap alone is ~25-30% — the make-or-break line

- Dual-chamber cap ~\$0.55 ■ Actives ~\$0.45 ■ Bottle/fill/label ~\$0.60
- Secondary/assembly ~\$0.42

Fully-loaded ~US\$2.45 with fulfilment & fees amortised across a 30-tube box. Every US\$0.10 off the cap ≈ 2.5 points of gross margin; scale >250k units can take the cap toward ~US\$0.35.

Gross margin by tier

On illustrative COGS vs. US pricing

Single RRP \$4.25 | ~53%

Subscription \$3.30 | ~39%

Blended sub CM | ~26-40%

Track to 100%. Margin is healthy at RRP, compressed on subscription — typical for a heavy liquid format, and exactly why bundles (not singles) are the only viable unit.

~3 : 1

Contribution LTV:CAC (CM2 basis)

\$5.40 → \$0.45

Per-tube fixed cost, single → 30-box

Freight + fees amortised

≤ A\$55

Target CAC ceiling (AU)

Category avg ~US\$61

The cap is buildable today — off the shelf.

A test-tube vial with an active dry-storage cap is manufacturable using existing press/twist-activate cap technology on a stock shot bottle — no need to invent the closure or tool a bespoke vial pre-launch. The gating risks are the dry-charge + cap-assembly co-packing step, ~50k/SKU cap MOQs, and melatonin in SETTLE.

CAP / PACKAGING TECH	WHAT IT DOES	FIT FOR MOSE
QuantixCap	Press/twist dual-chamber cap, 3–5 g (press) / 1–3 g (twist) dry powder; food-grade, FDA/EU	Closest off-the-shelf fit to "Pop, Shake, Pull"; co-packer-agnostic. Best starting point.
INCAP	Hermetically-sealed dosing cap; moisture + oxygen barrier; 28 mm holds 6.9 g	Explicit moisture barrier = the exact creatine-stability story
Amerigo "New Shaker"	Turnkey dual-chamber bottle; screw cap past ring → plunger pushes powder in; ~225M units sold in EU	Near-identical ritual + turnkey — could skip bottle/cap tooling entirely
Pont TWINCAP	7 ml airtight twist cap; EU supplier	EU/UK-side sourcing option; suits MOSE doses
Vessl + Nuspark	Patented pressurized auto-mix closure (Amway Phyto2GO, Glenlivet Twist)	Most proven but HIGH lock-in (proprietary line); revisit at scale, not pre-launch
SachetsCo (NSW, AU)	GMP dual-chamber sachet (powder + liquid)	Lower-capex fallback if active-cap co-packing can't be sourced — sacrifices the hero vial

~50k / SKU

Active-cap MOQ per design (~150k across 3 dayparts)
Cash tie-up before revenue

\$1.5-5k

Cap tooling / mould (cheap vs. bespoke bottle)
Favours stock bottle + custom cap

3+ yrs

Dry creatine shelf-life vs. ~90% loss in 45 days once wet

The reason the cap exists

The real bottleneck isn't the cap — it's assembly. Standard shot co-packers fill liquid only; almost none perform the dry-charge + cap-assembly step. The likely path is a hybrid: imported active cap + Australian GMP liquid fill (Tripak, Homart, Labceuticals), launching one hero SKU (PRIME) first to limit the cap commitment, with a dual-chamber stick-pack kept as a lower-capex fallback.

DTC, subscription-first, AU beachhead → US scale.

The hero SKU is the 30-tube monthly box (US\$99 / A\$149); single tubes exist only as a trial item. Revenue is recurring, with an upsell path across the three dayparts — start with one colour, build to the full day.

Dose integrity you can see — dry actives stay sealed until you drink, answering the ~46% gummy label-fail problem and creatine's fast liquid degradation.

One ritual, all day — a colour-coded PRIME/DRIVE/SETTLE system replaces stacking three separate products.

The dose you never miss — evidence-led, conservative doses built for adherence and a broad audience, not a megadose that gets abandoned.

Built for the new buyer — designed around the actual growth cohorts (women now ~30%; 50+ cognition), not just gym-goers.

Target segments

Health-engaged women (primary)

Now ~30% of creatine buyers (up from ~18%); projected >US\$9B revenue contribution. MOSE's conservative-dose, ritual-first, non-"bro" positioning is built for them.

Adults 50+ (cognition & longevity)

A fastest-growing creatine cohort; a 2025 review found 5/6 studies positive. Drawn to an easy, evidence-led daily habit and the dose-integrity story.

Convenience-first supplementers

The buyers driving +360% dollar / +1,300% search growth who want a portable single-serve ritual — and who've been burned by gummy dose failures.

Premium-ritual Australians (beachhead)

~15-20% of ~20M AU adults, open to a premium daily ritual in a market underserved on single-serve formats where LMNT is barely present.

Go-to-market

PHASE 1

AU DTC beachhead — one hero SKU (PRIME)

Convert the waitlist. Lead every asset with the daypart *system* and "Pop, Shake, Pull," not ingredient lists, to escape dose-vs-dose comparison. Make the dry-chamber freshness claim demonstrable (video + third-party potency data). Push a low-friction sampler, then the A\$149/mo box. Anchor against greens travel packs / RTD shots, not electrolyte sticks.

PHASE 2

Full line + AU consolidation

Launch DRIVE and SETTLE (AU SETTLE without melatonin). Drive the full-day upsell. Pre-empt price objections with "one vial replaces three purchases" math vs. stacking Optimum + LMNT + Moon Juice. Add selective boutique/pharmacy retail. Hold CM2 LTV:CAC ~3:1, CAC ≤A\$55, payback <2 months.

PHASE 3

US expansion for scale

Enter the US (40.8% of creatine spend) — the real scale market — with a US SETTLE SKU including compliant low-dose melatonin. Stand up a US 3PL to avoid cross-border freight on a heavy liquid product. Scale cap volume >250k to unlock margin and push toward A\$/US\$2-6M ARR.

Melatonin is the gating constraint.

PRIME and DRIVE stay food-regulated if kept as conservative-dose liquids with no therapeutic claims. SETTLE needs market-specific SKUs because melatonin is a medicine in most of MOSE's target markets. Structure-function language only — no disease claims anywhere.

INGREDIENT	AUSTRALIA	UK	EU	USA
Melatonin	Rx (S4) 55+ MR carve-out	POM (medicine)	≤1 mg food supp.	Supplement
Creatine	Food (3 g sports food)	3 g claim	3 g claim	Supplement
Caffeine	Capped + warnings	>150 mg/L warning	No claims + warning	~400 mg ref
EAA's / amino acids	Permitted	No claims	Claims rejected	Permitted
Magnesium glycinate	Permitted	Authorised claims	Authorised claims	Permitted
Lavender (Silexan-grade)	Complementary med.	Medicine at dose	Medicine	OTC supplement
L-theanine	Permitted	Novel-food grey	Source-dependent	Permitted
Glycine	Permitted	Permitted	Permitted	Permitted

Slovenia (launch market): a food supplement may contain melatonin only up to **0.44 mg/day** (JAZMP); anything higher is a medicine — so a general-retail SETTLE must be ≤0.44 mg or melatonin-free. EU-wide, supplements cluster at ≤1 mg (authorised claims at 0.5 mg jet-lag / 1 mg sleep-onset). AU melatonin is Schedule 4 prescription (bar a pharmacist-only ≤2 mg 55+ carve-out); UK/Canada prescription. The Slovenian route is a **notification to the Ministry of Health** (Directive 2002/46/EC + Reg 1169/2011), not pre-market approval. Creatine's only authorised EU claim is the 3 g/day physical-performance claim; **EFSA rejected all BCAA/EAA claims**, so DRIVE's aminos carry no claim. Caffeine drinks >150 mg/L need the mandatory on-pack warning.

Validate → prove → launch → scale.

MONTHS 0-3 · PHASE 0

Validate & de-risk

Grow the waitlist. Lock the pivotal architecture decision (mechanical press/twist active cap on a stock 30-60 ml shot bottle — not a pressurized Vessl-class closure or bespoke test-tube tooling). Get real quotes from 3+ specialty cap makers (QuantixCap, INCAP, Amerigo, Pont) modelled at 50k/250k/500k volumes. Reformulate SETTLE per market (drop melatonin for AU/UK).

MONTHS 3-9 · PHASE 1

Formulate & prove

Finalise conservative-dose formulas within FSANZ caffeine caps. Qualify a co-packer specifically on dry-charge + cap-assembly (hybrid: imported cap + AU GMP liquid fill). Run accelerated + real-time stability on each formula. Pre-clear mandatory caffeine warning statements. Produce a first ~2,500-5,000 unit run (~US\$20-40k).

MONTHS 9-15 · PHASE 2

AU DTC launch — one hero SKU

Launch PRIME first to de-risk the ~50k cap MOQ. Open DTC subscription (A\$149/mo box) + sampler. Lead marketing with the daypart system, "Pop, Shake, Pull," and a demonstrable dry-chamber freshness video with third-party potency data. Hold CAC $\leq$ A\$55 with sub-2-month payback.

MONTHS 15-24 · PHASE 3

Full daypart line + AU scale

Roll out DRIVE and SETTLE. Drive the full-day upsell. Add selective boutique/pharmacy retail. Validate DRIVE's EAA cost and adjust dose/price to keep blended COGS flat across colours. Reach the lower end of the 3,000-12,000 subscriber SOM band.

MONTHS 24-36+ · PHASE 4

US expansion

Enter the US with a US SETTLE SKU including compliant low-dose melatonin. Stand up a US 3PL to avoid cross-border freight. Push cap volume >250k to unlock margin. Scale toward A\$/US\$2-6M ARR.

Where it wins, and what could break it.

Strengths

- Unoccupied white space — no one owns the AM/midday/PM daypart *system*.
- A demonstrable format moat: dry-in-cap separation solves a real creatine stability problem and the ~46% gummy failure issue.
- Anchored on creatine, the fastest-growing supplement of 2024-25 (~20-26% CAGR).
- Adherence-first "conservative dose" aligns with the actual growth cohorts.
- Buildable today with off-the-shelf active-cap tech.

Weaknesses

- Price-per-serve gap: a buyer can DIY creatine + electrolytes for under US\$2.
- Single tubes are structurally unprofitable — the model depends on bundles/subs.
- Ingredient blends aren't novel; the wedge is sequencing + format, which must be marketed hard.
- Heavy liquid format makes freight a major margin swing vs. powder/capsule brands.
- ~150k caps committed across three dayparts before meaningful revenue.

Opportunities

- Australia is under-served on premium single-serve ritual (LMNT barely present).
- The US holds 40.8% of creatine spend — the real scale market once AU is proven.
- "One vial replaces three purchases" neutralises the price objection.
- Broadening demographics (women 18%→30%, growing 50+ cohort) expand the audience.
- Scale >250k cap units can add ~6-7 points of gross margin.

🎯 Threats

- Distribution-rich incumbents (AG1, LMNT, Liquid I.V., Recess \$68M-funded) own shelves & mindshare.
- Creatine NPD explosion (US/Canada products +59%/+51% in a year) — crowding.
- Melatonin prescription-only in AU/UK — SETTLE can't ship one global formula.
- SETTLE's stack is near-identical to Moon Juice at ~US\$1.40 — invites value comparison.
- Market sizings vary 2–3×; headline stats trace to secondary press — fundraising credibility risk.

Key risks & mitigations

RISK	MITIGATION
Price-per-serve objection (DIY under US\$2)	Out-position, don't out-price: lead with the system & ritual; frame "one vial replaces three purchases" with blended per-day cost.
Single-tube economics are unprofitable	Never sell singles as the hero; sampler → 30-tube subscription; amortise freight/fees across the box (\$5.40→\$0.45/tube fixed cost).
Dual-chamber cap = biggest COGS line, no public pricing	Treat the cap as the #1 sourcing priority; quote 3+ makers at 50k/250k/500k; every \$0.10 off ≈ 2.5 margin points.
Melatonin prescription-only in AU/UK	Reformulate SETTLE per market: AU/UK keep Mg glycinate + glycine + lavender, drop melatonin; reserve melatonin for US / select EU (≤1 mg).
Well-funded incumbents own mindshare & shelves	Beachhead in AU where premium single-serve is under-served; compete on the daypart-system white space, not head-to-head.
Manufacturing: almost no co-packer does dry-charge + cap assembly	Qualify partners specifically on that step (Amerigo turnkey + INCAP + AU GMP fill); launch one SKU; keep a stick-pack fallback.
Caffeine legal but hard-capped with mandatory warnings (AU)	Dose within FSANZ limits (≤200 mg/day) and pre-clear advisory statements before artwork; conservative dosing keeps headroom.
Market sizings vary 2–3×; stats from secondary press	Always cite ranges with named sources; label financials illustrative; buy a primary report (Circana/SPINS) before fundraising.

13 · STATUS & ACTION PLAN

What's done, what's on you, and what we do next.

Where MOSE stands today and the shortest path to a real, compliant first launch. The single most valuable move this week is booking the accountant — it unlocks the rebalancing that funds the build.

[pitch.html](#)

Fact-check

Advisory transcript verified against primary sources; errors corrected

[strategy-brief.md](#)

Two corrections baked in from the fact-check. (1) **Melatonin** at 3–5 mg is not a legal food supplement — Slovenia caps supplement melatonin at **0.44 mg/day** (JAZMP); above that it's a medicine (EU clusters ≤ 1 mg). SETTLE goes melatonin-free or ≤ 0.44 mg for SI/EU. (2) **s.p. social contributions are ~38%**, not 2% — with a ~€500/month floor regardless of profit. Both are detailed in the tax + strategy notes.

👤 Founder to-dos — only you can do these

#	DECISION / ACTION	WHY IT'S THE GATE	RECOMMENDATION
1	3 g vs 5 g creatine	Sets bottle size, format and cost — 5 g needs ~200–240 ml (not a shot); 3 g dissolves small	3 g (still the EU-claim dose)
2	SETTLE reformulation	3–5 mg melatonin is illegal as a SI/EU supplement	Melatonin-free now ; keep a low-dose US variant later
3	Book the accountant	Files CGT + interest (28 Feb), confirms T212 interest & s.p./d.o.o. — unlocks the rebalance that funds MOSE	Do this first (take the tax note)
4	Fresh Trading 212 statements + residency date	Feeds the tax filing	Download this week
5	Register the s.p. (teaching first)	Teaching pays the bills while MOSE builds; budget the ~€500/mo floor	normirani for teaching
6	Real product photos + add repo to scope	Replaces AI images; publishes the site to your live URL	When convenient

Roadmap — what we build together

● PHASE 0 · NOW-1 MONTH

Lock it down

Your decisions #1-2 + the accountant visit → I finalise the EU-compliant formulas, patch the melatonin figures everywhere, and publish the site once the repo is in scope.

● PHASE 1 · 1-3 MONTHS

Source & validate

I draft supplier outreach — active-cap quotes (QuantixCap / INCAP / Amerigo at 50k & 250k), Biostile (Komen) for the dry-charge + cap-assembly step, Hrastnik1860 for glass — you send and sign. I build the flavour × liquid-base × electrolyte compatibility matrix. Waitlist goes live.

● PHASE 2 · 3-9 MONTHS

Prototype & comply

Samples + accelerated/real-time stability testing; Ministry of Health notification; claims-compliant labels (Slovenian + EU languages — creatine 3 g claim & magnesium claims only); first ~2,500-5,000 unit run; pricing locked to real quotes.

● PHASE 3 · 9-15 MONTHS

Launch — PRIME first

Ship PRIME alone first to de-risk the ~50k-cap MOQ; DTC subscription + local boutique/pharmacy in Slovenia; then DRIVE and SETTLE; then wider EU.

Bottleneck order: taxes → funding → the 3 g/5 g dose decision → cap supplier → everything else. Clear them in that sequence and nothing downstream stays blocked.

14 · SOURCES & NOTES

What's cited, and what's assumed.

Market: Grand View Research (creatine, sports nutrition, dietary supplements, functional drinks, ANZ supplements 2025); Research and Markets / OG Analysis (creatine outlook); Future Market Insights (conservative creatine); Precedence, Mordor, Polaris, Fortune (sports nutrition / functional beverage / RTD 2025); SPINS via Nutritional Outlook & NutraIngredients (creatine +71.9% MULO, gummy +360%, NPD +59%/+51%); The Vitamin Shoppe 2025 Trend Report (search +1,300%); NOW Foods HPLC via Nutraceuticals World (~46% gummy label-fail); Circana via Bloomberg & MedicalXpress (women 18%→30%); Nutrition Reviews 2025 (creatine & cognition review); Expert Market Research / Statista (AU VMS).

Science: Kreider 2017 (PMID 28615996); NASEM DRIs 2019 (PMID 30844154); EFSA caffeine 2015 (EFSA J 13(5):4102); Nutrition Reviews 2025 (83(10):1873); Wolfe 2017 (PMID 28852372); Katsanos 2006 (PMID 16507602); Mah & Pitre 2021 (PMID 33865376); Yamadera 2007 (Sleep Biol Rhythms 5:126); Zhdanova 2001 (PMID 11600532); Brzezinski 2005 (PMID 15649737); Kasper 2014 (PMID 24456909).

Manufacturing & regulatory: QuantixCap, INCAP, Amerigo Laboratories, Pont TWINCAP, Vessl/Nuspark, SachetsCo product/supplier pages; TGA (melatonin scheduling, caffeine); FSANZ (caffeine, sports foods); MHRA (melatonin POM); EU health-claim register & EFSA; FDA/DSHEA.

Illustrative & concept status. MOSE is a pre-launch concept. All pricing, COGS, margins, LTV:CAC, TAM/SAM/SOM and revenue figures are illustrative planning assumptions built from public benchmarks — not sourced facts, quotes or forecasts — and must be confirmed with real co-manufacturer quotes and a primary market report before any commercial or fundraising use. Market sizes vary 2–3× across research firms and are shown as ranges with their sources. One earlier figure (creatine-gummies market at ~US\$0.8–1.2B) was found to be an order of magnitude high and corrected to ~US\$45–55M.

Not medical advice. Ingredient statements are structure-function only and have not been evaluated by any regulatory body; nothing here is intended to diagnose, treat, cure or prevent any disease. Ingredient legality is region-dependent — notably melatonin, which is prescription-only in Australia, the UK and much of the EU. Consult a healthcare professional before starting any supplement.
